## **PR-120 Double Reinforced Pavement over Box Culverts**

(This section last updated 11-14-19)

This standard includes double reinforced pavement. The intent is to reduce pavement issues related to potential differential settlement. This standard should not be used with new construction. Instead, it should be used where existing structures are being replaced. The most common uses for this standard include:

- Replacing a box culvert using open excavation.
- Replacing a bridge with a box culvert.

Typically, the backfill follows Standard Road Plan [DR-111](#).
